Dorene:

Attached is data from the storm drains in the residential area on the south side of the facility after the spill. Additionally, I am also providing the data for storm water that TCEQ removed from the same areas (this data is for disposal purposes).

I am talking to my people about us moving forward with filtering the stormwater through a bag filter (suspended solids removal) followed by filtering through Granulated Activated Carbon (GAC) for organics prior to releasing to the drainage pathway leading to the storm drains. This will allow us to clean the asphalt/concrete parking lot where we may be able to open the normal facility drains during a rainfall event. Unfortunately, the southern portion of the facility which looks to have 3/4 of the volume will have to be pumped from the pooled and diked area to the front to be released as there is no drainage except through the residential area which I prefer not to happen now. Currently, the water is draining off-site on the Wayland Side of the facility through the employee parking lot into the storm sewer as it gets to an overflow level.

I hope this helps.
